convenient entrée to two fundamental themes of Korean Sŏn vis à vis the doctrinal teachings of Buddhism in which Sŏn is shown to be superior and the *huatou* i.e. phrase Korean *hwadu* method of practice work originally popularized by the Song dynasty Chinese Chan master Dahui Zonggao. This method consists of raising to awareness or keeping an eye on the phrase usually no Korean *mu* no mental operation whatsoever is to be performed upon the phrase one lifts the phrase to awareness constantly when doing quiet cross-legged sitting as well as when immersed in the noisiness of everyday life. Core texts of the Sŏn approach which was published in Korea during the first decade of the twentieth century. The identity of the compiler is not known for certain. Contains eight Chan texts by Chinese authors two translated here and seven Sŏn texts by Korean authors three translated here showing the organic relationship between the parent Chinese tradition and its Korean inheritor. The set of translations in this volume will give readers access to some of the key texts of the Korean branch of this influential East Asian school of Buddhism.

Jeffrey L. Broughton and Elise Yoko Watanabe here offer a study and partial translation of core texts of the Sŏn approach *Sonmun Ch'waryo* a Korean anthology of key texts foundational to Korean Sŏn Buddhism which emphasizes attaining Buddhahood through the enlightenment of one's own mind. Korean Sŏn is much less well known in the West than the Japanese Zen tradition. This volume acts as a comprehensive overview of the texts of the Korean branch of this influential school of East Asian Buddhism.

This book develops the mathematical tools essential for students in the life sciences to describe interacting systems and predict their behavior from predator-prey populations in an ecosystem to hormone regulation within the body. The natural world abounds in dynamical systems that affect us profoundly. Complex feedback relations and counterintuitive responses are common in nature. This book develops the quantitative skills needed to explore these interactions. Differential equations are the natural mathematical tool for quantifying change and are the driving force throughout this book. The use of Euler's method makes nonlinear examples tractable and accessible to a broad spectrum of early-stage undergraduates, thus providing a practical alternative to the procedural approach of a traditional calculus curriculum. Tools are developed within numerous relevant examples with an emphasis on the construction, evaluation, and interpretation of mathematical models. Throughout encountering these concepts in context, students learn not only quantitative techniques but how to bridge between biological and mathematical ways of thinking. Examples range broadly, exploring the dynamics of neurons and the immune system through to population dynamics and the Google PageRank algorithm. Each scenario relies only on an interest in the natural world. No biological expertise is assumed of student or instructor. Building on a single prerequisite of precalculus, the book suits a two-quarter

sequence for first or second year undergraduates and meets the mathematical requirements of medical school entry the later material provides opportunities for more advanced students in both mathematics and life sciences to revisit theoretical knowledge in a rich real world framework in all cases the focus is clear how does the math help us understand the science

organizations value insights from reflexive iterative processes of designing interactive environments that reflect user experience i really like this definition of experience architecture which requires that we understand ecosystems of activity rather than simply considering single task scenarios donald norman the design of everyday things
